Differential abundance analysis

0.1 Differential abundance analysis

Analysis information:

- Taxonomic level: species

Taxa that are less prevalent than this (in relabundance) have been agglomerated:

- Detection threshold: 0.1%
- Prevalence threshold: 0.1
- Number of taxonomic groups: 252

BMI is not significantly different between conditions or time points. Hence we can ignore it in the differential abundance testing. In group "B" it seems to be borderline significant ($p<0.05$ before multiple testing adjustment).

Number of significant findings within time points.

- Kruskal test, Benjamini-Hochberg FDR adjustment

```
before  after
     1      8
```

Number of significant findings within treatments:

- Paired Wilcoxon test, Benjamini-Hochberg FDR adjustment

```
rice  oat
   9    7
```

Let us look more closely to the significant hits. The logFC corresponds to logFC in CLR (tp2-tp1).

Group	Taxon	logFC.clr	FDR	mean.relabundance1	mean.relabundance2
