

Differential abundance analysis

0.1 Differential abundance analysis

Analysis information:

- Taxonomic level: genus_prevalent

Taxa that are less prevalent than this (in relabundance) have been agglomerated:

- Detection threshold: 0.1%
- Prevalence threshold: 0.0714286
- Number of taxonomic groups: 139

BMI is not significantly different between conditions or time points. Hence we can ignore it in the differential abundance testing. In group “B” it seems to be borderline significant ($p < 0.05$ before multiple testing adjustment).

Number of significant findings within time points.

- Kruskal test, Benjamini-Hochberg FDR adjustment

before	after
0	2

Number of significant findings within treatments:

- Paired Wilcoxon test, Benjamini-Hochberg FDR adjustment

25	10

Let us look more closely to the significant hits. The logFC corresponds to logFC in CLR (tp2-tp1).
